Mechanical deformable mirror is one of the important components in adaptive optical systems. It changes the phase structure of the incident light wavefront by changing the optical path of the light wavefront transmission or the refractive index of the transmission medium, thereby achieving the purpose of correcting the phase of the light wavefront. The mechanical deformable mirror is composed of multiple units, each of which has its own independent controller. Under the control of an external voltage or mechanical force, the deformable mirror can change its mirror shape, thereby correcting the wavefront distortion of the light wave and improving the beam quality and imaging quality. Mechanical deformable mirrors have the characteristics of high precision, fast response and high stability. They are widely used in the transmission and wavefront correction of large-aperture lasers, high-quality focusing, aberration-free laser beam expansion and contraction, and imaging. They are key core devices in the fields of laser communication, astronomy, and high-energy lasers.

The global Mechanical Deformable Mirror market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
