The global Mechanical Rebar Splicing System market size is predicted to grow from US\$ 231 million in 2025 to US\$ 270 million in 2031; it is expected to grow at a CAGR of 2.6% from 2025 to 2031.

Mechanical Rebar Splicing Systems are used in reinforced concrete structures to replace normal rebar lap joints. The couplers are also suitable for use in reinforced concrete columns and walls. Each rebar coupler consists of a piece of rebar equipped with a thread and coupler sleeve at the right end as viewed in the direction of installation. In construction joints, rebar couplers can be used to replace all pieces of rebar going through the formwork.

The mechanical rebar splicing system is an innovative technology used for connecting reinforcing bars in concrete structures. This system employs specific mechanical devices to precisely join the ends of two rebars, creating a strong bond that enhances the overall strength and stability of concrete structures. In comparison to traditional methods like welding or threaded connections, the mechanical rebar splicing system eliminates the need for high-temperature operations or specialized tools, reducing construction complexity and time costs. Furthermore, this system offers increased connection reliability and engineering quality, bringing significant technological advancements to construction and infrastructure projects.
