A Mechanical Wrist Watch is a watch that uses a clockwork mechanism to measure the passage of time, as opposed to quartz watches which function electronically via a small battery. A mechanical watch is driven by a mainspring which must be hand-wound periodically. Its force is transmitted through a series of gears to power the balance wheel, a weighted wheel which oscillates back and forth at a constant rate. A device called an escapement releases the watch's wheels to move forward a small amount with each swing of the balance wheel, moving the watch's hands forward at a constant rate. This makes the 'ticking' sound characteristic of all mechanical watches.

Mechanical watches evolved in Europe in the 17th century from spring powered clocks, which appeared in the 15th century.
