A mechanically held lighting contactor is an electrical device used to control lighting systems. It is commonly used in commercial, industrial and residential buildings to control large lighting loads such as fluorescent lamps, high pressure gas discharge lamps, LED lamps, etc. Mechanically held lighting contactors have a mechanical holding mechanism that, once the contacts are closed, holds the contactor in the closed state until the contactor is opened by external manual operation. This design ensures that in the event of a power outage or control signal failure, the contactor remains closed, thus ensuring continued operation of the lighting system. Mechanically maintained lighting contactors provide reliability and stability in providing lighting system control and are widely used in many applications.

The global Mechanically Held Lighting Contactor market size is projected to grow from US\$ 260 million in 2024 to US\$ 356 million in 2030; it is expected to grow at a CAGR of 5.4% from 2024 to 2030.
