Polyethersulfone (PES) membrane materials possess characteristics such as high flow rate, low extractables, low protein adsorption, and excellent mechanical strength. They exhibit excellent heat and chemical resistance, being able to withstand organic solvents except chlorinated hydrocarbons, ketones, and alcohols. PES membranes also have good resistance to steam and superheated water (150-160 °C), poor UV resistance, excellent electrical properties, a V-0 flammability rating, and good mechanical properties. PES membranes feature low adsorption, high flux, high bubble point, low extractables, and low diffusion flow characteristics, offering highly stable performance. They have good chemical compatibility, and the membrane pore structure can be manufactured to be symmetric or asymmetric. PES membranes possess extremely low flow rate diffusion and stable sterilization capability. The asymmetric pore structure enhances flow rate and increases contaminant holding capacity, thereby extending the membrane's service life.
