Medical hyaluronic acid, the full name of which is sodium hyaluronate gel for medical cosmetology, is a filler material widely used in the field of medical cosmetology. It is mainly composed of sodium hyaluronate, a component naturally present in human skin and other tissues, with excellent water retention and lubrication. In the field of medical cosmetology, hyaluronic acid is used as a non-surgical facial filler to improve facial contours and reduce wrinkles. Through injection, hyaluronic acid can be accurately filled into different parts of the face, such as lips, nose, chin, temples, nasolabial folds, tear grooves, etc., thereby increasing the volume of tissues, enhancing facial contours, and making the face look fuller, younger and more three-dimensional. The advantages of medical hyaluronic acid are its safety, effectiveness and predictability. Since hyaluronic acid is a component existing in the human body itself, it has good biocompatibility and degradability, and will not cause obvious rejection or allergic reactions after injection. At the same time, the injection effect of hyaluronic acid can be seen immediately, and the effect is natural and long-lasting. In addition, doctors can accurately adjust the injection amount and injection site according to the patient's needs and facial features to achieve the best facial beautification effect.
