A medical cryocooler is a device designed specifically for use in the medical field that is capable of maintaining a low temperature environment. It is mainly used to refrigerate and cool medical equipment, samples, instruments and other biomedical applications to ensure that these devices or samples remain stable within the required temperature range. Medical cryocoolers typically use compression refrigeration cycles or thermoelectric refrigeration technology to reduce temperatures. These technologies maintain a low temperature environment through different working principles, such as the compression and condensation process of a compressor, or the temperature difference generated by an electric current in the thermoelectric effect. Medical cryocoolers are able to precisely control temperatures, typically between 0°C and -80°C, or even lower. This precise temperature control is essential to ensure the stability and performance of medical equipment, samples and instruments. Modern medical cryocoolers are typically equipped with a digital control panel, through which users can set the temperature, operating time and other parameters. This digital control improves the ease and accuracy of the device's operation.
