The global Medical Device Overmolding market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Medical device overmolding is a process that involves two materials; substrate, as the base material, and overmold molding which is molded over the substrate as the outer layer. The substrate material can be metal or polymer, whereas the overmolding material can be thermoplastic or elastomer (silicone). The basic premise of overmolding is to take economic advantage of two materials with uniquely different properties by incorporating them into a single-molded component. The medical components manufactured with the overmolding process are safe, resistant to electric shock, efficient, flexible, and functional. Overmolding is sustainable and environmentally friendly as it encourages the reduction of material waste and energy consumption.
