A distilled water machine refers to a machine that prepares pure water by distillation. It can be divided into single and multiple distilled water. The water is distilled once, the non-volatile components remaining in the container are removed, and the volatile components enter the initial fraction of distilled water, usually only the middle part of the fraction is collected, accounting for about 60%. In the pharmaceutical industry, the role of distilled water is due to hypotonicity. Rinse the surgical wound with distilled water, so that the tumor cells that may remain on the wound surface absorb water, swell, rupture, necrosis, and lose their activity, and prevent tumors from growing on the wound surface.
