Abstracts

The global Medical Dural Patches market size is predicted to grow from US\$ 845 million in 2025 to US\$ 1294 million in 2032; it is expected to grow at a CAGR of 6.3% from 2026 to 2032.

The dura mater is a thick, tough, double-layered membrane between the skull and brain, serving as a crucial natural protective barrier for the brain. Trauma, inflammation, tumor erosion, and surgical procedures can damage the dura mater, compromising its integrity.

Medical Dural Patches are sheet-like materials used to temporarily or permanently repair defects in the dura mater or spinal cord. Materials include non-absorbable synthetic materials such as polytetrafluoroethylene/polyurethane, absorbable synthetic materials such as polylactic acid/polycaprolactone, biogenic materials, and composite materials. These patches are used to repair defects in the dura mater or spinal cord caused by craniocerebral and spinal cord injuries, tumors, and other brain diseases, preventing serious complications such as cerebrospinal fluid leakage, intracranial infection, encephalocele, brain adhesions, and scarring, thereby restoring the integrity of the dura mater.

In 2025, global sales of Medical Dural Patches reached approximately 2,127 K Pcs, with an average global market price of around US\$ 406/Pcs. Production capacity varies significantly among manufacturers, with gross profit margins ranging from approximately 80% to 95%.

Large Market Potential:

Neurosurgery, one of the most complex medical disciplines, is a clinical surgical specialty that primarily uses surgery to treat diseases of the central nervous system (brain and spinal cord), peripheral nervous system, and autonomic nervous system. With the continuous improvement of living standards in China, the accelerated aging of the population, and factors such as accidental injuries, brain diseases primarily treated with surgery, such as brain tumors, craniocerebral trauma, cerebral hemorrhage, and functional neurological disorders, are also on the rise. Furthermore, with increasing awareness of diseases and the development of surgical instruments, treatment methods are changing. More and more conditions, such as epilepsy and pain, can now be effectively treated surgically. Overall, the field of neurosurgery has significant development potential. The market for high-value consumables used in neurosurgery is enormous.

High Degree of Domestication:

Compared to other high-value consumables, dural patches have a high degree of domestication, accounting for approximately 80% of the Chinese market share.

Increased policy support:

To reduce the burden of individual medical expenses and improve access to high-value medical consumables, the National Medical Insurance Administration (NMIA) has issued several new policies encouraging the expansion of reimbursement for these consumables, increasing the proportion of unified reimbursement, and achieving full coverage from urban residents' medical insurance to rural cooperative medical care. In response to these policies, local governments have continuously adjusted their medical insurance catalogs based on their respective fiscal strengths. These adjustments have led to a gradual decrease in out-of-pocket patient expenses and increased access to high-value medical consumables, driving continued growth in the dura mater patch market.
