The global Medical Electromagnetic Tracking System market size is predicted to grow from US\$ 1228 million in 2025 to US\$ 2377 million in 2031; it is expected to grow at a CAGR of 11.6% from 2025 to 2031.

Electromagnetic tracking, also referred magnetic tracking, employs sensors at the joints that record their movements by returning their locations and orientations to a central processor. Electromagnetic Tracking Systems (EMTSs) use electromagnetic field producers to detect the pose of electromagnetic sensors. EMTSs does not require a direct line-of-sight, however, the presence of metal or ferromagnetic sources in the operating workspace can affect the measurement accuracy. Electromagnetic (EM) tracking allows medical professionals to understand the position and orientation of medical devices, to a sub-millimeter level of accuracy. Another benefit of EM tracking is that it can track in and around people, walls, and even tools? no line-of-sight between the EM tracking components is required. This gives doctors the ability to track where devices are in 3D space and angular orientation, providing an added level of situational awareness.

Advancements in electromagnetic (EM) tracking systems enable a greater application of minimally invasive procedures. This adds value to interventional or robotic-navigated procedures, which are less invasive and proven to have fewer complications, shorter hospital stays, faster recovery, and lower overall costs. EM tracking systems increase access, precision, and navigation during procedures ? augmenting a clinician?s training and skill by tapping into the capabilities of tiny sensor assemblies integrated with finished medical devices and navigation equipment. It?s an advantage that is applicable in a great range of clinical applications, improving patient outcomes in cardiology and electrophysiology, vascular, interventional radiology and oncology, neurology, ENT,

orthopedics, pulmonology, and other procedural areas.
