Abstracts

The global Medical Electrosurgical Pen market size is predicted to grow from US$ 720 million in 2025 to US$ 972 million in 2032; it is expected to grow at a CAGR of 4.5% from 2026 to 2032.

In 2024, global sales of Medical Electrosurgical Pen reached approximately 24 million units, with an average market price of about USD 30 per unit, an annual production capacity of roughly 30 million units, and an industry-average gross margin of approximately 32%.

A medical electrosurgical pen is a handheld high?frequency electrosurgical device used for tissue incision, coagulation or haemostasis in general surgery, gynecology, urology and minimally invasive procedures. It connects to an electrosurgical generator and converts electrical energy into RF or high?frequency alternating current, delivered via an electrode tip to biological tissues for precise cutting or coagulation. Compared to conventional tools, it reduces operative time, minimises bleeding risk and enhances surgical precision.

In the supply chain, the upstream includes suppliers of metallic electrode materials (e.g., stainless steel or titanium alloys), insulation plastics or ceramic pen handles, and high?frequency electronics and generator interface modules; the downstream consists of hospitals, surgical centres, outpatient clinics and distribution channels. In the cost structure, material costs account for about 55% of total cost (metal electrodes ~30%, handle plastics/ceramics ~15%, electronics ~10%), labor and assembly ~20%, R&D and quality control ~10%, with remaining cost for packaging, logistics and regulatory certification. For downstream consumption, based on global surgical volumes, each surgery typically uses about 1–2 pens, which aligns with annual shipment volumes
