The global Medical Erythropoietin Injection market size is predicted to grow from US\$ 10510 million in 2025 to US\$ 16130 million in 2032; it is expected to grow at a CAGR of 6.4% from 2026 to 2032.

Erythropoietin is produced by interstitial fibroblasts in the kidney in close association with peritubular capillary and proximal convoluted tubule. It is also produced in perisinusoidal cells in the liver. While liver production predominates in the fetal and perinatal period, renal production is predominant during adulthood.

The Medical Erythropoietin Injection, used for treating anemia, is widely employed in conditions such as chronic kidney disease, cancer chemotherapy, and other anemia-inducing diseases. The market for this product is substantial, with promising sales prospects driven by an aging population and an increasing number of patients with chronic illnesses. Future developments may involve innovations in treatment approaches and manufacturing techniques to enhance the drug's efficacy and safety.
