The global Medical Film Coatings market size is predicted to grow from US\$ 942 million in 2025 to US\$ 1555 million in 2032; it is expected to grow at a CAGR of 7.6% from 2026 to 2032.

The term 'coating' usually implies a membrane formed directly on a substrate. It separates two phases between which fluids (gases, vapours or liquids) may be exchanged. It is distinguished from 'film', a term used interchangeably with coating, which, however, refers to a preformed, stand-alone membrane (a film becomes a coating when applied onto a substrate). When used in relation to solid dosage forms, a film coating can be defined as a polymer-based thin membrane applied onto the surface of tablets, capsules, granules and spheroidal unit dosage forms. The coating generally imparts certain desirable attributes to the dosage that are otherwise absent in the uncoated form. Such attributes include impartation of colour and branding marks, alteration of drug release properties, protection of sensitive ingredients or masking offensive odours or tastes, among others. Pharmaceutical coatings are usually dense, non-porous films obtained from polymeric substances and are typically 100 µm thick although films with much higher thickness are not atypical. The use of polymer film coatings is not limited to solid dosage forms: many other products are routinely encased in polymer films of various types. For example, medical devices are coated with silicone resins to provide lubricity and protection. It can be classified into two specific classes; functional FC can be used to modify or delay drug release as well as the aforementioned benefits in the non-functional coating. On the other hand, nonfunctional FC which is used to change tablet appearance, organoleptic properties, swallowing properties, and to protect tablets from the negative effect of the environment such as humidity, oxidation, and light effects.

According to our research, the global market for medical devices is estimated at US\$ 603 billion in the year 2023, and will be growing at a CAGR of 5% during next six years. The global healthcare spending contributes to occupy 10% of the global GDP and is continuously rising in recent years due to the increasing health needs of the aging population, the growing prevalence of chronic and infectious diseases and the expansion of emerging markets. The medical devices market plays a significant role in the healthcare industry. The market is driven by several factors, including the increasing demand for advanced healthcare services globally, advancements in medical technology, growing geriatric population, rising healthcare expenditure, and increasing awareness about early disease diagnosis and treatment.
