Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

Gelatin is a soluble protein obtained by the partial hydrolysis of collagen derived from the bones, hides and skins of animals (mainly from cows, pigs and fishes). To extract gelatin, the native collagen is rendered soluble via acid, alkaline or enzymatic treatment and then boiled in water.

For gelatin to be considered pharma-medical grade, it needs to meet certain standards:

Quality Control and Traceability

Testing, control and full traceability are important: careful selection of raw materials and suppliers, swift collection and transport, and strict testing and control of raw materials to ensure optimal quality and safety.

Technical specifications

Gelatin has to meet the specifications described within the pharmacopeia:

gel strength range

pH range

conductivity

loss on drying

zinc content

chromium content

microbiological limits

GMP Compliant

Gelatin needs to be produced in alignment with good manufacturing practices (GMP) suitable for its intended application (e.g. excipient, raw material for medical devices, tissue engineering etc). The process is audited by pharmaceutical companies.

Special Adaptations

Raw materials for medical devices and other specific applications (parenteral, regenerative medicine, cell culture, etc.) may have additional requirements depending on the final application, such as additional virus inactivation studies, free of endotoxins / pyrogens and free of mycoplasma.
