The rehabilitation robot glove is an intelligent device for the rehabilitation of hand motor function of stroke patients. It drives the finger joints to move through bionic pneumatic artificial muscles for symptoms such as finger spasms, paralysis, and paralysis, while helping to act on brain nerves to promote motor rehabilitation. The main body of the rehabilitation robot glove is made of fabric made of everyday gloves. The active end of the glove is equipped with flexible sensors that can collect finger movement information, which is equivalent to a data glove; the passive end of the glove adopts a wire drive method to imitate the driving method of human muscles. Wearing the soft glove device is like putting on clothes. The sensor of the active end glove can accurately capture the movement of each finger on the healthy side of the patient. Combined with wireless data transmission, the host then controls the passive glove to assist the affected hand to complete the same action.

The global Medical Hand Function Rehabilitation Robot Gloves market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
