Medical Imaging Fibre refers to a specialized type of optical fibre designed for high-resolution image transmission within medical diagnostic and interventional devices, particularly fibre-optic endoscopes. It consists of thousands of tightly packed optical cores, each acting as an individual pixel, enabling real-time, lossless image transmission from inside the human body to an external imaging system. These fibres offer high pixel density, excellent flexibility, low inter-core crosstalk, and strong bending resistance. Compliant with biocompatibility standards, medical imaging fibres are widely used in minimally invasive procedures, allowing for internal visualization, optical biopsy, and targeted therapeutic navigation without the need for direct tissue disruption.

United States market for Medical Imaging Fibre is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.

China market for Medical Imaging Fibre is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.

Europe market for Medical Imaging Fibre is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
