## Abstracts

The global Medical Information Ward Solution market size is predicted to grow from US\$ 2574 million in 2025 to US\$ 5265 million in 2032; it is expected to grow at a CAGR of 10.9% from 2026 to 2032.

The medical information ward solution is a management system built upon information technology and digital tools, designed to achieve efficient interconnection and intelligent management of patients, medical staff, medical equipment, and hospital beds. Centered on patient safety and clinical efficiency, the solution integrates clinical data, operational workflows, and service processes to enable real-time sharing of diagnostic and treatment information, closed-loop management of nursing procedures, efficient and transparent communication between patients and staff, and the traceability and analyzability of medical activities.

The growth of the medical information ward solution market is mainly driven by factors such as the digital transformation of hospitals, the increasing demand for closed-loop management of nursing processes, the shortage of medical and nursing staff, the increasing requirements for patient safety management, and the continuous advancement of smart hospital construction. As ward management shifts from traditional methods?characterized by paper records, manual rounds, and fragmented communication?toward a digital model centered on bedside terminals, electronic bedside displays, nurse call systems, mobile nursing, nursing station dashboards, vital signs monitoring, infusion management, and integration with Hospital Information Systems (HIS), hospitals can achieve real-time coordination of patient data, execution of medical orders, nursing tasks, bed status, risk alerts, and equipment data. This integration reduces manual entry errors while enhancing nursing efficiency and operational transparency within the ward. Meanwhile, the aging population, the increase

in patients with chronic diseases, the increased complexity of inpatient care, and hospitals' emphasis on quality control, patient experience, and refined operations have also driven the development of medical information ward solutions from single-point equipment construction to the integration of ward data platforms, medical-nursing-patient collaboration, and nursing quality management.
