## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

The principle of infrared thermometer temperature measurement is to convert the radiant energy possessed by infrared rays emitted by the measured object into electrical signals. The amount of infrared radiation energy is related to the temperature of the object itself, and the temperature of the object can be determined based on the size of the electrical signal. All objects above absolute zero will radiate infrared rays by themselves. The function of the infrared thermometer is to collect the infrared rays emitted by the objects. It will not emit any harmful radiation at all, so it is completely harmless to the human body.
