The global Medical Ion Chamber market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

The medical ionization chamber is a device that uses the ionization effect of ionizing radiation to measure the intensity or dose of ionizing radiation. It is mainly composed of electrodes at different potentials and a medium (usually gas) between them. When ionizing radiation enters the ionization chamber, ionized ion pairs are generated in the medium. These ion pairs drift to the negative and positive electrodes respectively under the action of the electric field, forming an ionization current. The intensity of the ionization current is proportional to the intensity of the radiation, so the intensity or dose of the ionizing radiation can be known by measuring the ionization current.
