A nebulizer is a drug delivery device that delivers medicine to the lungs in the form of a mist. These devices pump pressurized air through a liquid to create a fine mist that is inhaled through a mouthpiece or face mask. These machines are designed to treat asthma, cystic fibrosis, chronic obstructive pulmonary disease and other respiratory diseases. Asthma, chronic obstructive pulmonary disease (COPD) and other respiratory diseases place a huge economic burden on healthcare systems around the world. For example, according to statistics released by the Asthma and Allergy Foundation of America in April 2022, about 25 million people in the United States suffer from asthma. Likewise, according to a July 2021 article by the Greater London Authority, around 337,500 people in London suffer from asthma attacks due to poor air quality. The prevalence of these diseases has increased due to a combination of factors including increasing smoking population and poor air quality. According to the Global Strategy for the Diagnosis, Management and Prevention of Chronic Obstructive Pulmonary Disease report, the European Union spends around 6% of its total healthcare budget each year on managing respiratory diseases (direct costs). Furthermore, COPD accounts for around 60% of the EU's total annual expenditure on respiratory diseases, the report said. In emerging countries, the prevalence rate is gradually increasing, resulting in a large number of patients suffering from respiratory diseases. Various initiatives taken by the government to promote early diagnosis and treatment have resulted in an increasing number of patients receiving treatment. Additionally, the constant introduction of new products in the market, including vaping devices, is crucial to driving the adoption of these devices. The market is expected to witness substantial growth over the forecast period owing to rising incidence of respiratory diseases globally and increasing geriatric population. Growing demand for innovative respiratory drug delivery devices and rapid adoption of these devices among the patient population is likely to drive their usage over the forecast period.
