According to our research, the global market for medical devices is estimated at US\$ 603 billion in the year 2023, and will be growing at a CAGR of 5% during next six years. The global healthcare spending contributes to occupy 10% of the global GDP and is continuously rising in recent years due to the increasing health needs of the aging population, the growing prevalence of chronic and infectious diseases and the expansion of emerging markets. The medical devices market plays a significant role in the healthcare industry. The market is driven by several factors, including the increasing demand for advanced healthcare services globally, advancements in medical technology, growing geriatric population, rising healthcare expenditure, and increasing awareness about early disease diagnosis and treatment. Medical endoscope cold light source is used to provide illumination during endoscopic surgery. It is safe to use on sensitive areas of the body as it produces bright, focused light without excess heat. Fiber optic cables are used to connect light sources and endoscopes, guaranteeing high-quality and stable light output for precise visualization during diagnostic or surgical procedures. Modern minimally invasive medical procedures such as laparoscopy, arthroscopy and bronchoscopy (in which an endoscope is placed inside the body to examine or treat internal organs and structures) require the use of this technology. By improving vision, cold light sources allow doctors to perform treatments more precisely and safely. Increasing demand for minimally invasive procedures, improvements in endoscopic techniques, and increasing prevalence of different medical problems requiring endoscopy and surgery are all contributing to the growth of the market. The integration of wireless technology in the medical endoscope cold light source industry has become an important trend that can enhance the control and convenience during endoscopic procedures. Manufacturers hope to enhance the overall user experience and improve the workflow efficiency of medical professionals by introducing wireless capabilities. Medical professionals can wirelessly control and modify the light settings of the cold light source. With this feature, they can change brightness, color temperature and other lighting characteristics in real-time while performing tasks, even if they are not physically close to the light source. Some cold light systems come with mobile apps that can be downloaded and used on a tablet or smartphone. These apps allow healthcare professionals to manage and monitor light source settings from mobile devices, giving them greater flexibility and usability. Hence, the increasing integration of wireless

technologies is a key trend unlocking the growth potential of the industry. These new developments are primarily responsible for the overall growth of the market.
