Medical liquid embolic agents are specialized substances used in interventional radiology to block blood flow in targeted blood vessels, typically for treating vascular abnormalities such as arteriovenous malformations (AVMs), aneurysms, or tumors. These agents are delivered via a catheter and solidify or precipitate upon contact with blood or tissue, creating a durable embolization effect. Common types include cyanoacrylate glues, ethylene-vinyl alcohol copolymer (EVOH), and onyx-based systems, which vary in composition, viscosity, and application methods. They offer a minimally invasive treatment option, reducing the need for open surgery while providing precise vascular occlusion to manage bleeding or cut off blood supply to abnormal tissues.
