According to our (LP Info Research) latest study, the global Medical Percutaneous Puncture Robot market size was valued at US\$ 638.2 million in 2022. With growing demand in downstream market and recovery from influence of COVID-19 and the Russia-Ukraine War, the Medical Percutaneous Puncture Robot is forecast to a readjusted size of US\$ 856 million by 2029 with a CAGR of 4.3% during review period.

The research report highlights the growth potential of the global Medical Percutaneous Puncture Robot market. With recovery from influence of COVID-19 and the Russia-Ukraine War, Medical Percutaneous Puncture Robot are expected to show stable growth in the future market. However, product differentiation, reducing costs, and supply chain optimization remain crucial for the widespread adoption of Medical Percutaneous Puncture Robot. Market players need to invest in research and development, forge strategic partnerships, and align their offerings with evolving consumer preferences to capitalize on the immense opportunities presented by the Medical Percutaneous Puncture Robot market.

The Percutaneous Puncture Robot is used for percutaneous puncture procedures, which are primarily procedures to collect tissue samples for diagnostic purposes, such as the detection of early stage lung cancer, breast cancer and prostate cancer. During the biopsy procedure, the tissue sample is removed from the suspected target anatomy for further pathological examination. While traditional biopsy methods rely on the radiologist's manual insertion of the needle, the robotic-assisted method provides greater rigidity and precision through a more stable robotic arm than the manual method. It allows for a more accurate loop of the needle with the tissue sample. Imaging

techniques such as magnetic resonance imaging (MRI), ultrasound and CT are used to localise the target anatomy and use image feedback to guide the needle to the target anatomy. The percutaneous puncture surgery robot also has the ability to perform several procedures such as nephrostomy lithotripsy for the removal of kidney stones. The needle is inserted through a tiny incision in the patient's back and the kidney stone is removed.
