Medical picosecond laser tattoo removal equipment refers to a medical device designed for tattoo removal using picosecond laser technology. Picosecond laser is a high-energy, extremely short-pulse laser that can act on tattoo ink particles in a very short time, causing them to explode into tiny particles and be cleared by the lymphatic system, thereby achieving the purpose of tattoo removal. The working principle of medical picosecond laser tattoo removal equipment is mainly based on the interaction between laser and matter. When the picosecond laser is irradiated to the tattoo area, the high-energy laser pulse will quickly act on the tattoo ink particles, causing them to absorb a large amount of energy and explode in a short period of time. These tiny particles after the explosion will then be swallowed by phagocytes and excreted from the body through the lymphatic system, thereby achieving the removal of the tattoo. Medical picosecond laser tattoo removal equipment is mainly used in dermatology, laser department, medical cosmetology department, and medical cosmetology institutions. It can not only be used to remove tattoos of various colors and types, but also can be used to treat skin pigment diseases such as spots, freckles, etc.
