Abstracts

The global Medical Polyester Sutures market size is predicted to grow from US$ 1134 million in 2025 to US$ 1352 million in 2032; it is expected to grow at a CAGR of 2.6% from 2026 to 2032.

Medical polyester sutures are non-absorbable surgical sutures made from surgical suture material (i.e., polyester). They are characterized by a smooth surface, minimal tissue reaction, high strength, abrasion resistance, resistance to breakage, and ease of knotting with minimal unraveling. Medical polyester sutures are commonly used for suturing and ligating soft tissues in the human body.

In 2024, the global production of medical polyester sutures was 680 million units, with an average price of US$1.65 per unit. Gross profit margins typically range from 30% to 45%.

Medical polyester sutures rely on an upstream supply system of polyethylene terephthalate (PET) fiber raw materials, surface coating agents, medical lubricants, and sterile packaging materials. High-strength filament PET is a key raw material, affecting the suture's tensile strength, knot stability, and implantation stability. Downstream applications are primarily in cardiovascular surgery, orthopedics, general surgery, neurosurgery, and sports medicine, with extremely high usage in scenarios requiring high strength, long-term tension maintenance, and low elongation sutures, such as heart valve repair, vascular graft fixation, ligament reconstruction, tendon sutures, and sternal fixation. Clinically, there is a greater focus on the biocompatibility, long-term stability, and tissue reactivity of polyester sutures. Their non-absorbable, high-strength, and stable characteristics make them difficult to replace in structural repair surgeries, especially in the cardiovascular field where sustained support for over 10 years is

required.

Industry trends are evolving towards higher strength, lower coefficients of friction, and higher coating stability. Multi-strand braided structures and surface lubrication technologies are continuously being optimized to improve feel and reduce tissue damage. Driving factors include the increasing number of cardiovascular surgeries globally, rising demand for orthopedic sports medicine, increased structural repair surgeries due to an aging population, and increased procurement of high-strength sutures by hospitals in developing countries. Obstacles include pressure from non-absorbable sutures being replaced by some minimally invasive procedures, the potential long-term foreign body reaction risk of polyester sutures in certain tissues, high barriers to entry due to the long-term dominance of overseas high-end brands in the cardiovascular and orthopedic markets, increased product validation costs due to stringent registration standards in various countries, and intensified price competition and squeezed profit margins caused by centralized procurement and cost control by medical institutions.
