A Medical Pressure Infusor, often referred to as an IV pressure bag or simply an infusor bag, is a medical device used to administer fluids, medications, or blood products to patients intravenously (IV) at a controlled and consistent pressure. It is typically used during medical procedures, surgery, or in emergency situations to ensure the reliable and steady delivery of fluids into a patient's bloodstream.

The demand for intravenous (IV) therapies, including the administration of fluids, medications, and blood products, continues to rise. This is driven by the aging population, an increase in chronic diseases, and the need for various medical treatments.
