Radiofrequency (RF) is a form of electrical energy in the frequency range of 300 kilohertz (kHz) to 1 megahertz (MHz). RF has been used in medical applications for decades for such uses as sealing IV fluid bags. But it is the way RF is absorbed in the body that has made it one of today's most advanced surgical techniques, and the reason it is replacing lasers in everything from prostate cancer therapy to cardiovascular procedures. In application, RF medical devices transmit low frequency radio waves through electrodes, which cause ionic agitation, or friction, increasing the temperature of the tissue. Since a sharp boundary is created between the affected tissue and that surrounding it, surgeons can operate with a high level of precision and control, without much sacrifice to the adjacent normal tissue. The lower operating temperatures of RF, as compared to traditional electrosurgical or laser surgery tools, enables surgeons to remove, shrink or sculpt soft tissue while simultaneously sealing blood vessels. RF works particularly well on connective tissue, which is primarily comprised of collagen and shrinks when contacted by heat.
