Medical stone balls are a kind of mineralized balls that use medical stone as the main functional raw material and are sintered into a special process after being mixed with clay. Medical stone balls are made of high-quality medical stone as raw material and are carefully processed. They have stronger adsorption and permeability than the original ore. They are a sterile, non-toxic and pollution-free water mineralizer. Medical stone balls can absorb harmful substances in water, such as heavy metal ions, residual chlorine, etc., and release minerals and trace elements that are beneficial to the human body, thereby improving water quality and making the water purer and healthier. In addition, medical stone balls can increase the dissolved oxygen content of water, improve the biological activity of water, and make water easier to be absorbed and used by the human body. The various minerals and trace elements contained in medical stone balls are beneficial to the human body, can improve the physiological functions of the body, promote metabolism, and enhance immunity. These characteristics and functions of medical stone balls have made it widely used and recognized in modern life. As people's awareness of health and environmental protection continues to increase, the market demand for medical stone balls will continue to grow.

The global Medical Stone Balls market size is projected to grow from US\$ 298 million in 2024 to US\$ 405 million in 2030; it is expected to grow at a CAGR of 5.2% from 2024 to 2030.
