Medical TFT Display is a display component designed for medical equipment.

Medical TFT Display uses thin film transistors (TFT) as electronic control elements to display images by controlling the brightness of its backlight source. Each pixel is controlled by an independent transistor, making the display clearer and brighter. When electrons pass through each transistor, the charge excites the molecules of the liquid crystal material to twist it, adjusting the light resistance at different angles to achieve the purpose of controlling the color and brightness of the pixel. This technology gives the medical TFT display the characteristics of high resolution, high color reproduction and low power consumption.
