The global Medical Ultrasonic Electrosurgical Unit market size is predicted to grow from US\$ 3680 million in 2025 to US\$ 5265 million in 2032; it is expected to grow at a CAGR of 5.3% from 2026 to 2032.

In 2025, global Medical Ultrasonic Electrosurgical Unit production reached approximately 6.27 million units, with an average global market price of around US\$600 per unit. In 2025, the global 's total production capacity of Medical Ultrasonic Electrosurgical Unit reached 7.83 million units. The industry average gross profit margin of this product reached 43%.The medical ultrasonic electrosurgical unit is a high-frequency electrosurgical device. It mainly generates an ultrasonic frequency electrical signal through the main unit, which drives the transducer to convert electrical energy into high-frequency mechanical vibration. The energy is then applied to human tissue through the cutting head. The mechanical vibration generates cavitation and thermal effects to cut soft tissue, coagulate blood, and close blood vessels. Because no current passes through the human body during operation and causes little thermal damage to surrounding tissues, it is called a "bloodless scalpel".

The medical ultrasonic electrosurgical unit industry chain involves high-barrier, multidisciplinary collaboration. Upstream are core component suppliers, providing piezoelectric ceramic transducers, precision titanium alloy materials, high-end chips, and sensors?technological barriers are extremely high. The midstream is the core of the industry chain, mainly including the research, development, manufacturing, and integration of the main unit system and consumables, presenting a "main unit + specialized consumables" business model, dominated by a few international giants and emerging domestic companies. Downstream are surgical departments in hospitals at all levels, with demand driven by the increasing penetration rate of minimally invasive

surgery, medical insurance cost control, and domestic substitution policies. Strict Class III medical device regulations permeate the entire chain.

The medical ultrasonic electrosurgical unit market has broad prospects and strong growth momentum. In the short term, in the Chinese market, medical insurance cost control (DRG/DIP) and centralized volume-based procurement policies are accelerating the substitution of imports by cost-effective domestic brands, reshaping the market landscape. In the medium term, market growth is deeply intertwined with the continued increase in the penetration rate of minimally invasive surgery globally and in China, with application scenarios expanding from core departments to a wider range of specialties. Long-term development will be driven by technological integration and intelligentization, such as deep integration with surgical robots, the development of integrated platforms combining multiple energy sources, and the integration of AI and sensor technologies to achieve more precise surgical operations. Furthermore, with the improvement of primary healthcare capabilities and the enhanced competitiveness of domestic products, market penetration and overseas expansion will become important growth drivers.
