The global Medical Zipper market size is predicted to grow from US\$ 437 million in 2025 to US\$ 636 million in 2032; it is expected to grow at a CAGR of 5.6% from 2026 to 2032.

In 2024, the global production of medical zippers was 90.53 million units, with an average price of US\$4.7 per unit.

A medical zipper, also known as a skin closure device, is a non-invasive tool that uses adhesive strips and a sliding mechanism to close surgical incisions or lacerations without needles. Unlike sutures or staples, it's applied directly to the skin, which can make it less painful and faster to use. Medical zippers work by holding the edges of the skin together to promote healing.

Medical zippers rely on an upstream supply system for medical-grade polyurethane film, silicone elastic materials, non-woven fabric substrates, medical pressure-sensitive adhesives, and sterile packaging materials. These raw materials determine their waterproofness, breathability, adhesive strength, and skin compatibility. Downstream applications primarily include wound management, postoperative care, emergency and field medicine, routine wound closure, and plastic surgery. They are particularly prevalent in scenarios requiring repeated wound observation or treatment, such as abdominal surgery, plastic surgery incisions, emergency lacerations, large skin wounds requiring rapid closure, patients intolerant to traditional sutures, and environments in primary healthcare facilities requiring simplified procedures. Compared to sutures, medical zippers reduce puncture damage, minimize scarring, increase operational speed, and can be repeatedly opened for debridement or dressing changes, making them a potential replacement in some surgical procedures.

The industry is evolving towards higher adhesive stability, stronger tensile strength,

better skin compatibility, and longer effective service life. Driving factors include increased demand for reusable wound closure methods due to the rise in minimally invasive surgeries, increased procurement of non-invasive wound management products in primary care and home healthcare, rapid expansion of the cosmetic surgery market, a strengthening consumer preference for low-scarring healing, and increased sales of portable wound closure products driven by upgrades in military and emergency medical equipment. Obstacles include the fact that medical zippers cannot completely replace deep tissue sutures requiring high tension; their tensile strength is still limited compared to traditional sutures, and their sensitivity to skin moisture leads to unstable adhesion. Additionally, strict medical device regulations and long clinical validation cycles in various countries, coupled with insufficient acceptance of new consumables in some hospital procurement systems, and increased price pressure due to competition from reusable products.

The annual output of a single production line is typically 3 million–8 million units, with a gross profit margin usually between 25% and 40%.
