Medication for diabetes is a broad term that refers to any drug or treatment that helps people with diabetes manage their blood sugar levels. Blood sugar levels are affected by the amount of glucose (sugar) in the blood and the action of insulin, a hormone that helps cells use glucose for energy. People with diabetes either do not produce enough insulin, or their cells do not respond well to insulin, or both. This causes high blood sugar levels, which can lead to serious complications such as heart disease, kidney failure, nerve damage, and vision loss. Medication for diabetes aims to lower blood sugar levels to a healthy range and prevent or delay these complications.
