The global Medications for Alzheimer's Disease market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Medications for Alzheimer's disease are treatments aimed at managing symptoms and improving cognitive function in affected individuals. These medications mainly include cholinesterase inhibitors, such as donepezil, rivastigmine, and galantamine. Another class, NMDA receptor antagonists like memantine, helps protect neurons by regulating glutamate activity. Additionally, anti-amyloid therapies, such as lecanemab and donanemab, target the amyloid plaques associated with Alzheimer's pathology.

The Alzheimer's disease medication market is experiencing significant growth due to the rise of disease-modifying therapies, particularly anti-amyloid drugs like donanemab and lecanemab, which aim to slow disease progression. This growth is fueled by an aging population and increasing prevalence of the disease, prompting heightened research and development across various treatment mechanisms. Regulatory bodies are streamlining approval processes for new therapies, further enhancing market access. Additionally, there's a strong focus on personalized medicine and opportunities for expansion in emerging markets, contributing to a dynamic and evolving landscape in Alzheimer's treatment.
