A medium-capacity liquid ring vacuum pump is a positive displacement vacuum-generating device based on the principle of liquid ring compression. Its core structure consists of a pump body, impeller, liquid ring forming system, and drive unit. During operation, an appropriate amount of working fluid (such as water or industrial oil) is injected into the pump chamber. As the impeller rotates, centrifugal force causes the liquid to form concentric liquid rings, dividing the pump chamber into multiple crescent-shaped working chambers. The periodic volume changes caused by the impeller's rotation enable gas intake, compression, and exhaust, thereby establishing a vacuum environment.
