Abstracts

The global Medium Frequency Coreless Induction Furnace market size is predicted to grow from US\$ 1774 million in 2025 to US\$ 2871 million in 2032; it is expected to grow at a CAGR of 7.2% from 2026 to 2032.

In 2025, global sales of medium-frequency coreless induction furnaces reached 9,800 units, with an average selling price of US\$185,000 per unit. A medium-frequency coreless induction furnace is an electric furnace that uses a medium-frequency power supply to generate an alternating magnetic field, causing eddy currents in the metal material inside the furnace under electromagnetic induction, leading to rapid heating and melting. It is widely used in casting, alloy smelting, and metal recycling. The equipment mainly consists of a medium-frequency power supply cabinet, induction coils, furnace body, cooling system, and control system. It features rapid heating, precise temperature control, low metal composition loss, and low environmental emissions, and is suitable for various metal materials such as iron, steel, copper, and aluminum. Upstream raw materials include silicon steel sheets, copper coils, power electronic devices, and refractory furnace lining materials; downstream supplies mainly come to foundries, special alloy production enterprises, and metal recycling plants, delivered through equipment integrators and engineering companies. The industry's total capacity is approximately 12,000 units per year, with an average gross profit margin of approximately 27%. Future development lies in upgrading to energy-saving power supplies and integrating intelligent temperature control systems, while also aligning with the trends of green metallurgy and waste metal recycling. With increasingly stringent environmental policies and the accelerated replacement of traditional cupola furnaces, demand continues to grow steadily, and companies with power electronics technology and system integration capabilities will gain more market opportunities.
