Medium Temperature Brazing Material is a type of brazing filler metal that is used in the brazing process to join two metals together without melting the base materials. The process involves heating the filler metal to a temperature typically between 550°C and 800°C. This temperature range is above the liquidus temperature of the filler metal but below the solidus temperature of the base metals. The filler metal flows into the joint by capillary action and forms a strong bond upon cooling.

The global Medium Temperature Brazing Material market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
