The global Megasonic Cleaning Machine market size is predicted to grow from US\$ 312 million in 2025 to US\$ 454 million in 2032; it is expected to grow at a CAGR of 5.7% from 2026 to 2032.

A megasonic cleaning machine is a precision cleaning system that applies MHz-range acoustic energy in a liquid medium to remove sub-micron particles with a more refined, less damaging mechanism than conventional ultrasonics; it typically integrates a process tank or scanning/shower structure, megasonic transducers and generators, and process controls, and is widely used for semiconductor wafers, flat panel display substrates, HDD media, optics, and other high-cleanliness applications. In 2025, global Piezo PVDF Film sales reached approximately 1,400 Units, with an average price of 228 K US\$/Unit.

Growth is driven by escalating requirements for higher cleanliness with lower damage risk?particularly in semiconductor and display manufacturing where particle control is tightly linked to yield?along with a sizable installed base that supports tool upgrades and retrofits; suppliers continue to improve system efficiency, high-purity construction, and integrated generator-transducer performance, encouraging adoption through new line builds and modernization projects.
