The global Melamine Pyrophosphate market size is predicted to grow from US\$ 70.5 million in 2025 to US\$ 86.3 million in 2031; it is expected to grow at a CAGR of 3.4% from 2025 to 2031.

Melamine pyrophosphate, MPP flame retardant, is a halogen-free and environmentally friendly intumescent flame retardant containing nitrogen and phosphorus. Its outstanding advantages are good thermal stability, insoluble in water, low smoke, and no moisture absorption. .

Because composite materials such as plastics and rubber are mainly composed of organic compounds, they are highly flammable and pose a greater fire hazard. In reality, a class of additives that can prevent organic matter from igniting or inhibit flame spread is often added, that is, flame retardants. Flame retardants, also known as flame retardants, fire retardants or fire retardants, refer to functional additives that endow flammable polymers with flame retardancy. The flame retardant industry belongs to the rubber and plastic additives industry under the fine chemical industry. The upstream of the flame retardant industry chain is mainly raw materials such as phosphate, halogen resources, petrochemical products (such as propylene oxide, etc.). The midstream is the flame retardant industry, and its direct downstream is the flame retardant material and product industry, and the terminal applications are construction, household products, electronic appliances, transportation and other terminal application fields. As a material additive to reduce the ability of materials to ignite, plastic flame retardants have become an important additive for polymer materials. In recent years, the demand of China's flame retardant industry has continued to rise. In 2020, the demand will reach

899,000 tons. In 2021, the demand of China's flame retardant market will be about 976,000 tons.
