The global Melissa Oil market size is predicted to grow from US\$ 591 million in 2025 to US\$ 836 million in 2032; it is expected to grow at a CAGR of 5.2% from 2026 to 2032.

Global sales of melissa oil reached 1,855 tons in 2025, with an average price of US\$325,612 per ton.

Melissa oil, also known as lemon balm oil, is a pale yellow to amber-colored volatile essential oil extracted by steam distillation from the leaves and flower tips of the lemon balm (*Melissa officinalis* L.), a plant in the Lamiaceae family. Its Latin name, 'Melissa,' comes from the Greek word for 'bee,' named for its sweet citrus aroma that attracts bees. This essential oil has a fresh, sweet lemon scent with slight herbal and minty notes, and is one of the most precious and expensive essential oils, often referred to as the 'King of Oils.' The main active ingredients are citral (including geraniol and neraldehyde, with a content of approximately 40-70%), α -caryophyllene, geraniol, and germacrene D.

Melissa oil is extremely scarce and labor-intensive in terms of raw material supply. Global production is very low and concentrated in the Mediterranean temperate region (France, Bulgaria, Italy, etc.). The climate conditions in these regions (cool, humid, and well-drained) are ideal for lemon balm growth and ensure sufficient citral accumulation. Raw material costs account for 55-65% of the total cost. Due to the extremely low extraction rate (only 0.09%-0.3%), approximately 3.5-7.5 tons of dried leaves are needed to extract 1 kg of essential oil, making it the highest raw material consumption among all common essential oils. Furthermore, lemon balm requires planting until the second year before harvesting and can only be harvested 2-3 times per year. The long growth cycle and extended land occupation further increase raw material costs. Labor costs account for 25-30% of the total cost. Because lemon balm has a high water content (fresh leaves contain about 80%), it needs to be dried quickly to prevent

fermentation and spoilage. Furthermore, high-quality leaves must be manually selected before distillation, resulting in low mechanization. Processing costs account for approximately 15-20%. While steam distillation is a mature process, its extremely low yield leads to very high energy consumption per unit. Precise control of distillation time (usually 4-6 hours) is required to prevent the thermal degradation of citral. Quality control and testing costs account for 10-15%. GC-MS is needed to ensure that the citral content (geranialdehyde + nerol) is within the range of 40-70%, and strict detection of adulteration (commonly found in the market as lemongrass oil and litsea cubeba oil) is required. It is worth noting that while melissa oil and lemongrass oil are similar in composition (both contain high levels of citral), their aromas differ significantly in fineness. The latter is only 1/10 to 1/20 the price of the former. Therefore, melissa oil is one of the most adulterated and difficult-to-distinguish high-priced essential oils, leading to vastly different retail prices (ranging from \$100 to \$500 per kilogram).
