The global Membrane Electrode Coating Equipment market size is predicted to grow from US$ 165 million in 2025 to US$ 493 million in 2032; it is expected to grow at a CAGR of 17.2% from 2026 to 2032.

Membrane electrode coating equipment is a key equipment specially used for manufacturing membrane electrodes for fuel cells. Its main function is to accurately and evenly coat the catalyst layer on the proton exchange membrane, which is one of the key factors for fuel cell performance.

Specifically, membrane electrode coating equipment usually includes unwinding mechanism, coating head, baking oven, rolling mechanism and winding mechanism. When working, the unwinding mechanism releases the proton exchange membrane, and the coating head coats the first catalyst layer and the second catalyst layer on the A side and B side of the proton exchange membrane according to the preset parameters. After coating, the catalyst layer will be baked in the baking oven to remove the solvent and fix the catalyst layer. Subsequently, the rolling mechanism will compact the catalyst layer to improve its density and stability. Finally, the coated membrane electrode will be rolled up by the winding mechanism for subsequent processing and use.

In addition, membrane electrode coating equipment also has the advantages of high precision, high stability and high repeatability, which can ensure that each coating can achieve the expected effect. At the same time, with the continuous development of technology, membrane electrode coating equipment is also constantly updated to meet the fuel cell industry's demand for higher performance, lower cost and more environmental protection.
