The global Membrane Treatment Chemicals market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Membrane treatment chemicals are a class of specialty chemicals used to clean and maintain the performance of membrane systems. During the application of membrane technology, membrane materials may become contaminated, clogged or degraded. At this time, membrane treatment chemicals are needed to restore the membrane's permeability, selectivity and overall performance. Membrane treatment chemicals are often formulated to effectively clean different types of membrane materials and contaminants. They can remove organic matter, inorganic salts, biofouling, etc. on the membrane surface and restore the membrane flux and separation efficiency.

With the increasing awareness of environmental protection, membrane cleaning chemicals will pay more attention to environmental performance. In the future, the development of low-toxic, low-residue, and easily degradable cleaning chemicals will become mainstream to reduce potential harm to the environment and human body.
