The global Memory Module PMIC market size is predicted to grow from US\$ 3130 million in 2025 to US\$ 9955 million in 2032; it is expected to grow at a CAGR of 16.6% from 2026 to 2032.

Memory Module PMIC is a power management integrated circuit mounted on memory modules to regulate and sequence voltages for DDR5 and other advanced memory standards. It moves key power regulation functions from the motherboard to the module, improving power integrity and supporting higher memory speeds. In 2025, global Memory Module PMIC production reached approximately 120,000 K units.

Growth is driven by DDR5 penetration in servers and PCs. Server memory modules carry higher PMIC value because of reliability, monitoring and power requirements, while client modules contribute larger volume as DDR5 becomes mainstream in new platforms.

AI server demand adds another layer of support. High-capacity RDIMMs and faster memory speeds increase the need for stable local power management, and memory vendors require PMIC suppliers that can pass strict platform qualification.

The market is cyclical because it follows DRAM module shipments, but the structural shift from DDR4 to DDR5 increases PMIC content per module. Supplier qualification is difficult, so major memory vendors tend to work with a limited group of validated PMIC suppliers.
