## Abstracts

The global MEMS Acoustic Camera market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of %from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

An acoustic camera is an imaging device used to locate sound sources and to characterize them. It consists of a group of microphones — also called microphone array — that are simultaneously acquired to form a representation of the location of the sound sources. With this method the sound signal is shown and also a sequence of acoustic images can be acquired as acoustic videos are generated at same time. The latest development in acoustic cameras are acoustic cameras based on MEMS microphones (MicroElectrical-Mechanical System) as opposed to the traditional array microphones. MEMS microphones are also called chip-seen microphones or silicon microphones as they are produced on the basis of silicon-chip technology. Acoustic cameras based on MEMS microphones and FPGA technology are significantly cheaper than traditional acoustic cameras, so acoustic cameras have become more accessible in terms of budget.

The Acoustic Camera was the first commercially viable system using beamforming to visually localize acoustic emissions. Brought to the market in 2001 as a pioneering technique, the Acoustic Camera has over the years become a metaphor for beamforming systems in general. The tool is now used in a variety of industries and has a growing customer base worldwide.
