The global MEMS Microphone Foundry Service market size is predicted to grow from US\$ 699 million in 2025 to US\$ 1110 million in 2032; it is expected to grow at a CAGR of 7.0% from 2026 to 2032.

MEMS microphone foundry service refers to a one-stop foundry service from design, manufacturing, packaging to testing specifically for MEMS microphone manufacturers. MEMS microphone foundry service is a professional, one-stop service model that aims to provide customers with high-performance, high-quality MEMS microphone product solutions. With the continuous development of technologies such as the Internet of Things, smart homes, and automotive electronics, the MEMS microphone foundry service market will present a broader development prospect.

The core of MEMS microphones lies in combining micromechanical structures (such as diaphragms and backplates) with integrated circuit technology to achieve miniaturization (millimeter-level size), low power consumption (microwatt-level), and high signal-to-noise ratio (some products exceeding 75dB). These microphones are widely used in consumer electronics, automotive electronics, and industrial control. The gross profit margin of the foundry service industry is approximately 40-60%.

Market drivers mainly include:

Explosive growth in demand from consumer electronics and automotive intelligence: The increasing demand for high-quality, low-power microphones from consumer electronics such as smartphones and TWS earphones is driving the upgrade of foundry services towards high-end products. In the automotive sector, the advancement of autonomous driving levels (such as the transition from L3 to L4) requires more

microphones for in-vehicle voice interaction and external environmental perception, increasing the number of microphones per vehicle from a few to dozens, becoming a new growth engine for the foundry market.

Technological iteration and cost optimization needs: The integration of MEMS and CMOS processes (such as MEMS-on-CMOS) reduces power consumption and cost, driving the widespread adoption of microphones from high-end to mid-to-low-end models. Foundries, through large-scale production and process optimization, help end-product manufacturers balance performance and cost, accelerating the commercialization of new technologies. Policy support and industrial environment upgrades: Global policy support for the Internet of Things and smart manufacturing provides subsidies and tax incentives for MEMS microphone OEM services; domestic 'new four modernizations' (electrification, intelligentization, connectivity and sharing) policies promote the improvement of the local supply chain, and OEMs seize the high-end market opportunity by building automotive-grade certification and reliability testing capabilities.
