## Abstracts

The global MEMS Mirrors market size is predicted to grow from US\$ 320 million in 2025 to US\$ 628 million in 2031; it is expected to grow at a CAGR of 11.9% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

MEMS mirrors are miniature electromagnetic mirrors that incorporate MEMS technology. MEMS mirrors feature a wide optical deflection angle and high mirror reflectivity as well as low power consumption.

There are three main application areas for MEMS mirrors: laser scanning, optical communication, and digital display. Scanning mirrors can be used in laser radar, 3D cameras, barcode scanning, laser printers, and medical imaging; optical communications mainly refer to optical add/drop multiplexers, optical attenuators, optical switches, and gratings; digital display refers to applications in high-definition television, laser micro-projection, digital cinema, automotive head-up display (HUD), laser keyboards, and augmented reality (AR).

With the advancement of MEMS technology, the size of micromirror components is getting smaller and smaller, while the degree of integration is also increasing, which enables them to be used in various miniaturized devices. The new generation of MEMS mirrors has higher scanning rates, larger scanning angles and better optical performance, which can meet the market demand for high-performance products. These technological improvements make MEMS mirrors more potential for application in high-resolution displays and fine laser applications. Advanced manufacturing processes (such as silicon-based MEMS, FIB (focused ion beam) etching, 3D printing,

etc.) reduce the production cost of MEMS mirrors while improving production efficiency and product consistency.
