The global Mercury-Free Alkaline Battery market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Mercury-free alkaline batteries are a type of disposable battery that does not contain any mercury in its composition. Mercury is a toxic heavy metal that can have harmful effects on human health and the environment. Alkaline batteries are commonly used in everyday devices such as remote controls, flashlights, and toys. However, traditional alkaline batteries contain a small amount of mercury, which can pose a risk if the battery is disposed of improperly. Mercury-free alkaline batteries are an alternative that eliminates this risk while still providing reliable power. They contain zinc, manganese dioxide, and potassium hydroxide, which work together to create a chemical reaction that generates electrical energy. In addition to being safer, mercury-free alkaline batteries are also more environmentally friendly. They can be recycled through standard household recycling programs, reducing the amount of hazardous waste that ends up in landfills.

United States market for Mercury-Free Alkaline Battery is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
