According to our LPI (LP Information) latest study, the global Mercury Removal market size was valued at US\$ million in 2023. With growing demand in downstream market, the Mercury Removal is forecast to a readjusted size of US\$ million by 2030 with a CAGR of % during review period.

The research report highlights the growth potential of the global Mercury Removal market. Mercury Removal are expected to show stable growth in the future market. However, product differentiation, reducing costs, and supply chain optimization remain crucial for the widespread adoption of Mercury Removal. Market players need to invest in research and development, forge strategic partnerships, and align their offerings with evolving consumer preferences to capitalize on the immense opportunities presented by the Mercury Removal market.

Mercury is present in most natural gas fields in concentrations from 1 ppm as elemental (metallic), organic, and also inorganic compounds. Mercury removal to non-detectable levels is important since it is toxic, can poison catalysts used in downstream process units, and can damage downstream equipment through liquid-metal embrittlement (LME), a form of corrosion leading to crack initiation and propagation primarily in equipment constructed from aluminum. It has resulted in numerous equipment failures, unscheduled shutdowns, and in some cases fires. Mercury removal from natural gas can be achieved using either non-regenerative or regenerative adsorbents. In both cases hydrocarbon gas enters the top of an adsorption tower and flows downward through the adsorbent where the mercury is adsorbed, exiting the bottom for further processing or sale. Regenerable systems have two or more adsorption towers enabling

one to be regenerated while the remaining tower(s) are in operation. Bed regeneration is accomplished by flowing heated regeneration gas upward so that contaminants adsorbed near the inlet can be removed without flushing them through the entire bed. Protection of the beds from liquid water contamination is critical to ensure effective mercury removal and long, reliable bed life.
