Mesoporous bioactive glass, composed of elements such as calcium and silicon, is a new type of ordered mesoporous bioactive glass material synthesized and developed on the basis of bioactive glass materials. Compared with traditional bioactive glass, mesoporous bioactive glass is considered a better alternative material for bone tissue repair, skin surface repair, tooth repair, etc. due to its uniform nanoscale mesoporous structure and high specific surface area. After soaking in a simulated physiological solution in the human body, it can form hydroxyapatite with a surface similar to natural bone in a short period of time, which has high bioactivity and strong biodegradability. Therefore, it is considered a better alternative material for bone tissue repair, skin surface repair, tooth repair, etc.

The global Mesoporous Bioactive Glass market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
