Abstracts

The global Meta-xylene market size is predicted to grow from US\$ 2610 million in 2025 to US\$ 3747 million in 2032; it is expected to grow at a CAGR of 5.5% from 2026 to 2032.

Meta-xylene (m-xylene) is an aromatic hydrocarbon with the formula C_8H_{10} and one of the three xylene isomers (ortho-, meta-, and para-xylene). In industry, it is typically recovered from reformat or other refinery/petrochemical aromatic streams and may be obtained through separation and/or xylene isomerization/separation schemes, then used as a chemical intermediate feedstock or as an industrial solvent. In 2025, global Meta-xylene sales reached approximately 2,900 kilotons, with an average price of 920 US\$/Ton.

Demand for Meta-xylene is fundamentally tied to derivative chain throughput, especially where it serves as a primary feedstock for oxidation routes to isophthalic acid and related intermediates, creating structurally "sticky" consumption in integrated aromatics-to-acids value chains that prioritize continuous operation and feedstock reliability. Solvent uses in coatings, inks, adhesives, and similar applications add a secondary layer of volume, but overall market momentum is largely shaped by the operating rates and expansion decisions of downstream resin, polyester-modification, and specialty intermediate producers that convert m-xylene into higher-value products.
